

POWER CABLE MOUSE GUARD

The photos pretty much explain it – I cut the two aluminum sheets to 6" X 6". I drilled a pilot hole in the center of each sheet and then used an 11/16" hole saw to cut the hole. I scribed lines from the side of each plate and cut the slot with metal shears. There were some sharp edges on each plate that I dressed with a file.

Installation is easy – slip one plate over the cable and then slip the other one over the cable from the opposite direction. Secure the plates together with two paper clips and clip a clothes pin over the cable to keep the guard from slipping.
